

Insurance AI Assistant — Frontend v2

Change summary: adding signup / login / logout to the existing chat UI

1. What Changed

Area	v1 (before)	v2 (now)
Access	Anyone could chat immediately as a fixed demo user (USER_ID = 1)	Chat is gated behind login/signup; user id comes from the authenticated account
Landing state	Straight to chat window	Auth panel (Login / Sign up tabs) shown first if no session
Sidebar	Brand + New conversation + upload only	Adds a user panel: signed-in name/email, Logout button
Session	None — no concept of a logged-in user	Session persisted client-side in localStorage (insurance-ai-user)
Chat & new-chat guards	None	Submitting a question or starting a new chat while logged out redirects to the login tab with a status message
Backend calls	/api/chat, /api/upload-document, /api/feedback	Adds /api/login and /api/signup

2. New UI Structure (index.html)

Added a `<section id="auth-panel">` between the header and the chat app, containing a two-column auth-card: left side is copy/value props, right side is a tabbed Login / Sign up form. Added `#chat-app` wrapper around the existing chat window and composer so it can be hidden as one unit. Added a `#user-panel` block inside the sidebar footer showing sign-in state and a Logout button.

3. New Styling (style.css)

Added `.auth-panel`, `.auth-card`, `.auth-copy`, `.auth-points`, `.auth-tabs/.auth-tab`, `.auth-form`, `.auth-field`, and `.auth-submit/.auth-status` rules, all reusing the existing design tokens (`--ink`, `--brass`, `--paper`, `--font-display/--font-body`) so the login screen matches the rest of the app rather than looking bolted on. Added `.user-panel` and `.logout-btn` for the sidebar account block. Both `.auth-panel` and `.chat-app` support an `.is-hidden` class used to toggle between the login screen and the chat screen.

4. New Behavior (app.js)

Session handling:

```
currentUser is loaded from localStorage on page load (loadStoredUser). storeUser() saves it back on successful login/signup; clearStoredUser() removes it on logout. showAuthView() / showChatView() / applyAuthState() decide which panel is visible based on whether currentUser is set.
```

Auth requests:

`submitAuth(endpoint, payload, submitButton, successMessage)` is a shared helper for both the login and signup forms. It POSTs JSON to `/api/login` or `/api/signup`, disables the submit button while in flight, stores the returned user on success, and shows an inline error via `setAuthStatus` on failure.

Gating:

The chat-form submit handler and the New conversation button now check `currentUser` first. If nobody is logged in, they switch to the login tab, show "Please log in..." in the auth status line, and reveal the auth view instead of proceeding. Once logged in, chat requests send `user_id: currentUser.id` instead of the old hardcoded `USER_ID`.

Unchanged:

Clause-tab citations, feedback thumbs, PDF upload, and markdown rendering of answers all work exactly as in v1 — none of that logic was touched.

5. Files Touched

`templates/index.html` — added auth-panel section, chat-app wrapper, user-panel block.

`static/style.css` — added auth/user-panel styling, reused existing tokens.

`static/app.js` — added session storage, `submitAuth()`, auth-mode tab switching, login/signup/logout handlers, and login gating on chat submit / new conversation.

6. Assumed Backend Contract

POST `/api/login` — body `{email, password}` → returns `{id, name, email}` on success, or an error with a "detail" message on failure.

POST `/api/signup` — body `{name, email, password}` → same response shape as login.

If the actual response fields differ, only `submitAuth()`'s `storeUser(data)` call and the fields read off `currentUser` (`id`, `name`, `email`) need to change — everything else is independent of the exact shape.

7. Verification

Load the app logged out → auth panel shows, chat is hidden. Sign up a new account → redirected into chat view, sidebar shows name/email. Refresh the page → still logged in (`localStorage`). Log out → back to auth panel, sidebar reverts to guest copy. Try sending a message while logged out → blocked with an inline message instead of hitting `/api/chat`.
